Deploy Java App to Minikube Automated with Jenkins

1. Overview

Automating the deployment of a Java application to Minikube using Jenkins involves building the application, creating a Docker image, pushing it to a container registry, and deploying it to Minikube using Kubernetes manifests.

2. Key Concepts

A. Jenkins Pipeline

Jenkins automates the CI/CD process using a declarative pipeline. The pipeline consists of multiple stages such as:

- **SCM Checkout:** Fetches code from a repository (GitHub/GitLab).
- **Build & Test:** Uses Maven (mvn package) to compile and test the Java application.
- Docker Build & Push: Builds a Docker image of the application and pushes it to Docker Hub.
- **Deploy to Minikube:** Uses kubectl to apply Kubernetes deployment and service files.

B. Minikube

Minikube is a lightweight Kubernetes cluster for local development and testing. It allows developers to run Kubernetes locally and deploy applications without needing a cloud-based cluster.

Commands to Start Minikube:

sh

CopyEdit

minikube start

kubectl cluster-info

C. Docker

Docker is used to package the Java application into a container image, making it portable and easy to deploy across environments.

Dockerfile Example:

dockerfile

CopyEdit

FROM openjdk:11

COPY target/webapp.jar /app/webapp.jar

WORKDIR /app

CMD ["java", "-jar", "webapp.jar"]

D. Kubernetes Deployment

Kubernetes YAML files define how the application should be deployed inside the Minikube cluster.

Deployment YAML Example:

yaml
